Facial Recognition verifies if two faces are same. The use of facial recognition is huge in security, bio-metrics, entertainment, personal safety, etc. The same python library face_recognition used for face detection can also be used for face recognition. Our testing showed it had good performance.

Theory or face detection classifiers A computer program that decides whether an image is a positive image (face image) or negative image (non-face image) is called a classifier. A classifier is trained on hundreds of thousands of face and non-face images to learn how to classify a new image correctly.

In this work we propose a simple yet effective face detector that combines several face/eye

detectors that possess different characteristics. Specifically, we report an extensive study for combining face/eye detectors that results in a final system we call FED that combines three face detectors that extract regions of candidate faces from an image with two approaches for eye detection: the ...
