Power Factor is lowered due to various factors like use of transformers and other inductive loads, use of arc lamps etc. Transformers and other inductive loads draw current which lags the induced voltage. This causes huge amount of current to be drawn as the reactive power increases and the power factor decreases.

Power System MCQs with Explanatory Answers

An example of an electric power system is the grid that provides power to an extended area. It is a network which consists generation, distribution and transmission system. It is the subfield of electrical engineering that deals in preventing damage such as overheating of generators and motors, to reduce transmission losses and to maintain the ...

Steady State Stability of a Power System. The steady-state stability of a power system is defined as the ability of the system to bring itself back to its stable configuration following a small disturbance in the network (like normal load fluctuation or action of automatic voltage regulator).It can only be considered only during a very gradual and infinitesimally small power change.
